Concentration

13 of 26 wells cause 82% of NPT

Two Short Wells Have the Worst NPT Rates:

19-B and F-11 lost over half their rig hours, but each logged under 650 hours. Exploration wells average 29.8% NPT against 17.2% for development wells.

NPT cost an estimated \$98.6M

5 wells account for about **\$43M** of modeled downtime cost

High NPT did not predict lower production

Oil producers only ; Bubble size shows modeled NPT cost

NPT %, Cum Oil Bbl and Total NPT Cost
by wellbore_key and wellbore_key

What the Data says:

- F-14 ran at 13.0% NPT and was the most efficient producer, at 0.015 NPT hours per thousand barrels.
- F-12 ran at 17.9% NPT and produced the most oil, 28.8 million bbl.
- F-11 lost 56.2% of its hours to NPT and still produced 7.2 million bbl.
- F-5 had 10.1% NPT but only 0.24 million bbl, the worst hours-per-barrel ratio (0.91).

Conclusion

Among the six wells with oil data, high NPT did not go with low production. The best and the largest producers had moderate NPT, and the highest-NPT well still produced. Output varied by well, and NPT rate doesn't explain it. This is a small sample, so treat it as a pattern and not a proof. Water injectors are excluded.
